

There was much interest this morning among the student body as our oval finally started to look like an oval again!

ABOVE: large attractive sandstone blocks surround a stairwell that students can use to access the oval from the T Block area.

A layer of low quality soil (sand, clay) will be topped with good quality top soil and grass planted. The oval is raised higher than previously with underground drainage channels and a slight northerly slope to improve drainage after heavy downpours.

RIGHT: Work was also done today on the Cre8 Studio where the concertina doors wouldn't open properly. This was because the lentil supporting the roof needed to be reinforced.
